1.1 Vector Spaces

1.1.1 Introduction to Vector Spaces

Definition 1.1.1 (Vector Space). A vector space V over a field \mathbb{F} is a set with two binary operations, $+: V \times V \to V$ and $\cdot: V \times \mathbb{F} \to V$ such that all of the following hold.

- 1. For all $x, y \in V$, x + y = y + x. (Additive Commutativity)
- 2. For all $x, y, z \in V$, x + (y + z) = (x + y) + z. (Additive Associativity)
- 3. There exists an element, denoted 0, in V such that for all $x \in V$, x + 0 = x.
- 4. For each $x \in V$ there exists a $y \in V$, denoted -x, such that x + y = 0.
- 5. For all $x \in V$, 1x = x.
- 6. For all $a, b \in \mathbb{F}$ and $x \in V$, a(bx) = (ab)x.
- 7. For all $a \in \mathbb{F}$ and $x, y \in V$, a(x+y) = ax + ay.
- 8. For all $a, b \in \mathbb{F}$ and $x \in V$, (a + b)x = ax + bx.

Furthermore, x + y is called the *sum of* x *and* y while ax is called the *product of* x *and* a. Moreover, each $x \in V$ is called a *vector* and each $a \in \mathbb{F}$ is called a *scalar*.

Definition 1.1.2 (*n*-tuple). An object of the form (a_1, a_2, \ldots, a_n) where $a_j \in \mathbb{F}$ for all $1 \leq j \leq n$, is called an *n*-tuple.

Example 1.1.1. Let \mathbb{F} be a field and $n \in \mathbb{N}$, then $\mathbb{F}^n = \{(a_1, a_2, \dots, a_n) | a_j \in \mathbb{F} \forall 1 \leq j \leq n\}$ forms a vector space under component-wise addition and multiplication as defined below for $(a_1, a_2, \dots, a_n), (b_1, b_2, \dots, b_n) \in \mathbb{F}^n$ and $k \in \mathbb{F}$.

$$(a_1, a_2, \dots, a_n) + (b_1, b_2, \dots, b_n) = (a_1 + b_1, a_2 + b_2, \dots, a_n + b_n)$$

 $k(a_1, a_2, \dots, a_n) = (ka_1, ka_2, \dots, ka_n)$

Furthermore, it said that

$$(a_1, a_2, \dots, a_n) = (b_1, b_2, \dots, b_n)$$

if and only if $a_i = b_i$ for all $1 \le j \le n$.

Proof. \mathbb{F}^n is a vector space trivially from the fact that \mathbb{F} is a field.

Definition 1.1.3 (Matrix). Let \mathbb{F} be a field and $m, n \in \mathbb{N}$, then an $m \times n$ matrix with entries from \mathbb{F} is a rectangular array of the form

$$A = \begin{pmatrix} a_{1,1} & a_{1,2} & \dots & a_{1,n} \\ a_{2,1} & a_{2,2} & \dots & a_{2,n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m,1} & a_{m,2} & \dots & a_{m,n} \end{pmatrix}$$

where $a_{i,j} \in \mathbb{F}$ for all $1 \leq i \leq m$ and $1 \leq j \leq n$. The entries $(a_{i,1}, a_{i,2}, \ldots, a_{i,n})$ is called the *ith row* of the matrix and is a row vector in \mathbb{F}^n . The entries $(a_{1,j}, a_{2,j}, \ldots, a_{m,j})$ is called the *jth column* of the matrix and is a column vector in \mathbb{F}^n . We denote the entry on the *i*th row and *j*th column as $A_{i,j}$. Furthermore, two $m \times n$ matrices, A and B, are equal if and only if $A_{i,j} = B_{i,j}$ for all $1 \leq i \leq m$ and $1 \leq j \leq n$; we denote this by A = B. Moreover, if n = m we say that A is a *square matrix*. Lastly, we denote the set of $m \times n$ matrices over \mathbb{F} as $M_{m \times n}(\mathbb{F})$.

Example 1.1.2. Let \mathbb{F} be a field and $m, n \in \mathbb{N}$, then $M_{m \times n}(\mathbb{F})$ is a vector space over \mathbb{F} under the following operations for $A, B \in M_{m \times n}(\mathbb{F})$ and $k \in \mathbb{F}$.

$$(A+B)_{i,j} = A_{i,j} + B_{i,j}$$
$$(kA)_{i,j} = kA_{i,j}$$

Proof. The proof is trivial from the fact that we operating on multiple copies of a field.

Example 1.1.3. Let S be a nonempty set and let \mathbb{F} be a field and let $\mathscr{F}(S,\mathbb{F})$ denote the set of all functions from S into \mathbb{F} . Two elements $f,g\in\mathscr{F}(S,\mathbb{F})$ are equal if and only if f(s)=g(s) for all $s\in S$. Then $\mathscr{F}(S,\mathbb{F})$ is a vector space under the following operations for $f,g\in\mathscr{F}(S,\mathbb{F})$ and $k\in\mathbb{F}$.

$$(f+g)(s) = f(s) + g(s)$$
$$(kf)(s) = k [f(s)]$$

Proof. The proof is trivial because all operations are done inside the field, and thus the space inherits the structure from \mathbb{F} .

Definition 1.1.4 (Polynomial Ring). Let \mathbb{F} be a field. Then the ring of polynomials in an indeterminate x over \mathbb{F} , denoted $\mathbb{F}[x]$ is defined as

$$\mathbb{F}[x] := \{ \sum_{i=0}^{n} a_i x^i | n \in \mathbb{N}, (a_0, a_1, \dots, a_n) \in \mathbb{F}^n, a_n \neq 0 \}.$$

Additionally, we define $x^0 = 1$. Moreover, for each $p = \sum_{i=0}^n p_i x^i \in \mathbb{F}[x]$, the degree of p, denoted deg p, is n. Furthermore, if p = 0, that is $p_n = p_{n-1} = \ldots = p_0 = 0$, then p is called the zero polynomial and deg p = -1 or deg $p = -\infty$ depending on convention. If deg p = 0, then we say p is a constant polynomial. Lastly, $\mathbb{F}[x]$ forms a ring under the following operations where $p, q \in \mathbb{F}[x]$ and without loss of generality assume, deg $p \ge \deg q$.

$$p + q = \sum_{i=0}^{\deg q} (p_i + q_i) x^i + \sum_{i=\deg q+1}^{\deg p} p_i x^i$$
$$pq = \sum_{k=0}^{\deg p \cdot \deg q} \left(\sum_{i+j=k} p_i q_j \right) x^k$$

Example 1.1.4. Let \mathbb{F} be a field, then $\mathbb{F}[x]$ is a vector space over \mathbb{F} under polynomial addition and scalar multiplication by constant polynomials.

Proof. Since $\mathbb{F}[x]$ is a ring, it is closed under addition. Since constant polynomials are polynomials, it is closed under scalar multiplication. Since $\mathbb{F}[x]$ is a ring, addition is commutative and associative. Moreover the zero polynomial is the additive identity and likewise serves as the zero vector. Since $\mathbb{F}[x]$ is a ring, each $p \in \mathbb{F}[x]$ has a unique $-p \in \mathbb{F}[x]$ such that p + (-p) = 0. The constant polynomial 1 is the multiplicative identity in the ring and serves as the identity in the vector space. Furthermore, multiplication is associative and distributes over addition because $\mathbb{F}[x]$ is, indeed, a ring.

Proposition 1.1.1. If u, v, w are elements of a vector space V such that x + z = y + z then, x = y.

Proof. Since $z \in V$, then there exists a $-z \in V$ such that z + (-z) = 0. Thus, x + z = y + z implies

$$x + z - z = y + z - z$$

and ergo x = y.

Proposition 1.1.2. The zero vector in any vector space V is unique.

Proof. Assume there exists two zero vectors in V denoted 0_1 and 0_2 . Then $v + 0_1 = v$ and $v + 0_2 = v$ for all $v \in V$. Therefore it is true that

$$0_2 = 0_2 + 0_1 = 0_1 + 0_2 = 0_1$$

and thus these identities are in fact the same.

Proposition 1.1.3. Let V be a vector space and let $v \in V$, then there exists a unique $u \in V$ such that v + u = 0.

Proof. Assume v has two inverses, namely u_1 and u_2 . Then $v + u_1 = 0$ and $v + u_2 = 0$. Therefore,

$$v + u_1 + u_2 = 0 + u_2 = u_2$$

and

$$v + u_1 + u_2 = v + u_2 + u_1 = 0 + u_1 = u_1.$$

Ergo, $u_1 = u_2$ and the inverse of v is unique.

Proposition 1.1.4. Let V be a vector space over a field \mathbb{F} , then:

- 1. 0x = 0 for all $x \in V$;
- 2. a0 = 0 for all $a \in \mathbb{F}$;
- 3. (-a)x = -(ax) = a(-x) for all $x \in V$ and $a \in \mathbb{F}$.

Proof (1): Consider 0x + 0x. Then,

$$0x + 0x = (0+0)x = 0x = 0 + 0x.$$

Since 0x + 0x = 0 + 0x, by cancellation, we have 0x = 0.

Proof (2). Consider a0 + a0.

$$a0 + a0 = a(0+0) = a0 = a0 + 0$$

Thus, by cancellation, a0 = 0.

Proof (3). Consider -(ax). We know that -(ax) is the unique additive inverse of ax, thus it is enough to show that (-a)x and a(-x) are inverses of ax.

$$ax + (-a)x = (a - a)x$$

$$= 0x$$

$$= 0$$

$$ax + a(-x) = a(x - x)$$

$$= a0$$

$$= 0$$

Thus a(-x) and (-a)x are inverses of ax and (-a)x = -(ax) = a(-x).

1.1.2 Subspaces

Definition 1.1.5 (Subspace). A *subspace*, W, of a vector space, V, over a field, \mathbb{F} , is a subset of V that is also a vector space over \mathbb{F} .

Example 1.1.5. For any vector space V, V and $\{0\}$ are subspaces of V. The latter is called the zero subspace.

Theorem 1.1.5. Let V be a vector space over a field \mathbb{F} and let $W \subseteq V$. Then W is a subspace of V if and only if all of the following are satisfied.

- $0 \in W$.
- For all $x, y \in W$, $x + y \in W$.
- For all $a \in \mathbb{F}$ and $x \in W$, $ax \in W$.

 $Proof. \Rightarrow \text{Since } W \text{ is a subspace of } V, 0 \in W \text{ and } W \text{ is closed under } V\text{'s vector addition and scalar multiplication.}$

 \Leftarrow Since V is a vector space W inherits associativity, commutativity, and distributivity from V as well as V's behavior with respect to the identities. Furthermore, $0 \in W$ by assumption. All that is left to show is that W contains additive inverses. Suppose $x \in W$, then by assumption $-x = (-1)x \in W$. Thus W is a subspace of V.

Definition 1.1.6 (Matrix Transpose). Let M be an $m \times n$ matrix, then the transpose of M, denoted M^T , is the $n \times m$ matrix defined by $(M^T)_{i,j} = M_{j,i}$, that is

$$M^{T} = \begin{pmatrix} M_{1,1} & M_{2,1} & \dots & M_{m,1} \\ M_{1,2} & M_{2,2} & \dots & M_{m,2} \\ \vdots & \vdots & \ddots & \vdots \\ M_{1,n} & M_{2,n} & \dots & M_{m,n} \end{pmatrix}.$$

Definition 1.1.7 (Symmetric Matrix). Let M be a matrix, then if $M = M^T$, we say M is symmetric.

Example 1.1.6. The set of symmetric $n \times n$ matrices over a field \mathbb{F} , denoted $W_{n \times n}(\mathbb{F})$, is a subspace of $M_{n \times n}(\mathbb{F})$.

Proof. Consider the zero matrix. Since the zero matrix is an $n \times n$ matrix with all entries equal to zero, the transpose of the zero matrix is also an $n \times n$ matrix with all entries equal to zero. Thus, $0 = 0^T$ and the zero matrix is symmetric.

Let $A, B \in W_{n \times n}(\mathbb{F})$. Then $A = A^T$ and $B = B^T$. By definition of symmetry and matrix transpose we have

$$A_{i,j} = (A^T)_{i,j} = A_{j,i} (1.1)$$

and

$$B_{i,j} = (B^T)_{i,j} = B_{j,i} (1.2)$$

for all $1 \le i, j \le n$.

Consider (A + B). By definition we have

$$(A+B)_{i,j} = A_{i,j} + B_{i,j}$$
.

By Equation 1.1 and Equation 1.2 we have

$$(A+B)_{i,j} = A_{i,j} + B_{i,j} = A_{j,i} + B_{j,i}$$
.

The definition of matrix transpose implies that

$$(A+B)_{i,j} = A_{i,j} + B_{i,j} = A_{j,i} + B_{j,i} = (A^T)_{i,j} + (B^T)_{i,j}$$

and thus by definition of matrix addition,

$$(A+B)_{i,j} = A_{i,j} + B_{i,j} = A_{j,i} + B_{j,i} = (A^T)_{i,j} + (B^T)_{i,j} = (A^T+B^T)_{i,j}$$

Ergo, A + B is symmetric and $W(\mathbb{F})$ is closed under matrix addition.

Let $k \in \mathbb{F}$ and consider kA. We know by definition that

$$(kA)_{i,j} = k \cdot A_{i,j}$$
.

We invoke Equation 1.1 again to get that

$$(kA)_{i,j} = k \cdot A_{i,j} = k \cdot A_{j,i}$$
.

Applying the definition of matrix transpose yields.

$$(kA)_{i,j} = k \cdot A_{i,j} = k \cdot A_{j,i} = k \cdot (A^T)_{i,j}.$$

Lastly, by definition of scalar multiplication we have,

$$(kA)_{i,j} = k \cdot A_{i,j} = k \cdot A_{j,i} = k \cdot (A^T)_{i,j} = (kA^T)_{i,j}.$$

Thus kA is symmetric and $W(\mathbb{F})$ is closed under scalar multiplication.

Definition 1.1.8 (Main Diagonal of a Matrix). Let \mathbb{F} be a field and let $M \in M_{n \times n}(\mathbb{F})$, then the main diagonal of M is the set $\{M_{i,i}\}_{i=1}^n$.

Definition 1.1.9 (Diagonal Matrix). Let \mathbb{F} be a field and let $A \in M_{n \times n}(\mathbb{F})$, then A is called a *diagonal matrix* if and only if whenever $i \neq j$, $A_{i,j} = 0$.

Example 1.1.7. Let \mathbb{F} be a field and let $D_n(\mathbb{F})$ be the set of all diagonal matrices in $M_{n\times n}(\mathbb{F})$, then $D_n(\mathbb{F})$ is a subspace on $M_{n\times n}(\mathbb{F})$.

Proof. We know $0 \in D_n(\mathbb{F})$ since for all $i, j, 0_{i,j} = 0$. Let $A, B \in D_n(\mathbb{F})$. Then for all $i \neq j, A_{i,j} = B_{i,j} = 0$. Thus, $(A + B)_{i,j} = A_{i,j} + B_{i,j} = 0 + 0 = 0$ whenever $i \neq j$ and A + B is diagonal. Let $k \in \mathbb{F}$. Then $(kA)_{i,j} = k \cdot A_{i,j} = k \cdot 0 = 0$ and kA is diagonal. Therefore $D_n(\mathbb{F})$ forms a subspace of $M_{n \times n}(\mathbb{F})$.

Definition 1.1.10 (Trace of a Matrix). Let \mathbb{K} be a field and let $M \in M_{n \times n}(\mathbb{K})$, then the trace of M denoted tr M is defined as

$$\operatorname{tr} M = \sum_{i=1}^{n} M_{i,i}$$

or the sum of the elements on the main diagonal.

Example 1.1.8. Let \mathbb{K} be a field and let $T_n(\mathbb{K})$ be the set of matrices in $M_{n \times n}(\mathbb{K})$ with trace equal to zero, then $T_n(\mathbb{K})$ is a subspace of $M_{n \times n}(\mathbb{K})$.

Proof. Obviously, the zero matrix has a trace of zero and thus $0 \in T_n(\mathbb{K})$. Let $A, B \in T_n(\mathbb{K})$ then $\operatorname{tr} A = 0$ and $\operatorname{tr} B = 0$. Consider $\operatorname{tr}(A + B)$.

$$\operatorname{tr}(A+B) = \sum_{i=1}^{n} (A+B)_{i,i} = \sum_{i=1}^{n} (A_{i,i} + B_{i,i}) = \left(\sum_{i=1}^{n} A_{i,i}\right) + \left(\sum_{i=1}^{n} B_{i,i}\right) = \operatorname{tr} A + \operatorname{tr} B = 0$$

Thus, A + B has trace 0 and $A + B \in T_n(\mathbb{K})$. Let $k \in \mathbb{K}$. Consider $\operatorname{tr}(kA)$.

$$\operatorname{tr}(kA) = \sum_{i=1}^{n} (kA)_{i,i} = \sum_{i=1}^{n} k \cdot A_{i,i} = k \sum_{i=1}^{n} A_{i,i} = k \operatorname{tr} A = 0$$

And thus, kA has trace 0 and $kA \in T_n(\mathbb{K})$. Therefore $T_n(\mathbb{K})$ is a subspace of $M_{n \times n}(\mathbb{K})$.

Theorem 1.1.6. Let V be a vector space over a field \mathbb{F} and let W be a countable collection of subspaces of V. Then

$$W_i = \bigcap_{W \in \mathcal{W}} W$$

is a subspace of V.

Proof. Since $0 \in W$ for all $W \in \mathcal{W}$, $0 \in W_i$. Let $x, y \in W_i$, then $x, y \in W$ for all $W \in \mathcal{W}$ and thus $x + y \in W$ for all $W \in \mathcal{W}$. Therefore, $x + y \in W_i$. Let $a \in \mathbb{F}$. Since $x \in W$ for all $W \in \mathcal{W}$, $ax \in W$ for all $W \in \mathcal{W}$. Ergo, $ax \in W_i$ and W_i is a subspace of V.

Proposition 1.1.7. For any matrix A, $[(A^T)^T] = A$.

Proof. Apply the definition of matrix transposition twice.

$$[(A^T)^T]_{i,j} = (A^T)_{j,i} = A_{i,j}$$

Proposition 1.1.8. For any matrix A, $A + A^T$ is symmetric.

Proof. Consider $(A + A^T)_{i,j}$.

$$(A + A^{T})_{i,j} = A_{i,j} + (A^{T})_{i,j} = A_{i,j} + A_{j,i} = A_{j,i} + A_{i,j} = A_{j,i} + (A^{T})_{j,i} = (A + A^{T})_{j,i} = [(A + A^{T})^{T}]_{i,j}$$
And thus, $(A + A^{T})$ is symmetric.

Proposition 1.1.9. Let \mathbb{K} be a field and let $A, B \in M_{n \times n}(\mathbb{K})$ and $a, b \in \mathbb{K}$, then $\operatorname{tr}(aA + bB) = a \operatorname{tr} A + b \operatorname{tr} B$. *Proof.*

$$\operatorname{tr}(aA + bB) = \sum_{i=1}^{n} (aA + bB)_{i,i}$$

$$= \sum_{i=1}^{n} [(aA)_{i,i} + (bB)_{i,i}]$$

$$= \left(\sum_{i=1}^{n} a \cdot A_{i,i}\right) + \left(\sum_{i=1}^{n} b \cdot B_{i,i}\right)$$

$$= a\left(\sum_{i=1}^{n} A_{i,i}\right) + b\left(\sum_{i=1}^{n} B_{i,i}\right)$$

$$= a\operatorname{tr} A + b\operatorname{tr} B$$

Definition 1.1.11 (Sum of Subsets of a Vector Space). Let S, R be nonempty subsets of a vector space V, then the sum of S and R, denoted S+R is defined as $S+R=\{s+r|s\in S,r\in R\}$.

Proposition 1.1.10. Let U, W be subspaces of a vector space V over a field \mathbb{F} . Then U + W is a subspace of V and is the smallest subspace containing both U and W.

Proof. Since U and W are subspaces, $0 \in U$ and $0 \in W$ therefore, $0 = 0 + 0 \in U + W$. Let $x, y \in U + W$ then there exist $u_x, u_y \in U$ and $w_x, w_y \in W$ such that $x = u_x + w_x$ and $y = u_y + w_y$. Thus,

$$x + y = (u_x + w_x) + (u_y + w_y) = (u_x + u_y) + (w_x + w_y).$$

Since U and W are subspaces, $u_x + u_y \in U$ and $w_x + w_y \in W$. Ergo, $x + y = (u_x + u_y) + (w_x + w_y) \in U + W$. Let $a \in \mathbb{F}$. Then,

$$ax = a(u_x + w_x) = au_x + aw_x.$$

Since U and W are subspaces, $au_x \in U$ and $aw_x \in W$. Ergo, $ax = au_x + aw_x \in U + W$ and U + W is a subspace of V.

We know that, set-wise, $U=\{u+0\}_{u\in U}$ and $W=\{0+w\}_{w\in W}$, and thus $U,W\subseteq U+W$. Let X be a subspace of V such that $U,W\subseteq X$. Let $x\in U+W$, then there exists some $u\in U\subseteq X$ and $w\in W\subseteq X$ such that x=u+w. Therefore, $x=u+w\in X$ and $U+W\subseteq X$ for all subspaces X containing U and W. Ergo, U+W is the smallest subspace of V containing U and W.

Chapter 2

Definitions

2.1 Vector Spaces

2.1.1 Introduction to Vector Spaces

Definition 2.1.1 (Vector Space). A vector space V over a field \mathbb{F} is a set with two binary operations, $+: V \times V \to V$ and $\cdot: V \times \mathbb{F} \to V$ such that all of the following hold.

- 1. For all $x, y \in V$, x + y = y + x. (Additive Commutativity)
- 2. For all $x, y, z \in V$, x + (y + z) = (x + y) + z. (Additive Associativity)
- 3. There exists an element, denoted 0, in V such that for all $x \in V$, x + 0 = x.
- 4. For each $x \in V$ there exists a $y \in V$, denoted -x, such that x + y = 0.
- 5. For all $x \in V$, 1x = x.
- 6. For all $a, b \in \mathbb{F}$ and $x \in V$, a(bx) = (ab)x.
- 7. For all $a \in \mathbb{F}$ and $x, y \in V$, a(x+y) = ax + ay.
- 8. For all $a, b \in \mathbb{F}$ and $x \in V$, (a + b)x = ax + bx.

Furthermore, x + y is called the *sum of* x *and* y while ax is called the *product of* x *and* a. Moreover, each $x \in V$ is called a *vector* and each $a \in \mathbb{F}$ is called a *scalar*.

Definition 2.1.2 (*n*-tuple). An object of the form (a_1, a_2, \ldots, a_n) where $a_j \in \mathbb{F}$ for all $1 \leq j \leq n$, is called an *n*-tuple.

Definition 2.1.3. Let \mathbb{F} be a field and $m, n \in \mathbb{N}$, then an $m \times n$ matrix with entries from \mathbb{F} is a rectangular array of the form

$$A = \begin{pmatrix} a_{1,1} & a_{1,2} & \dots & a_{1,n} \\ a_{2,1} & a_{2,2} & \dots & a_{2,n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m,1} & a_{m,2} & \dots & a_{m,n} \end{pmatrix}$$

where $a_{i,j} \in \mathbb{F}$ for all $1 \leq i \leq m$ and $1 \leq j \leq n$. The entries $(a_{i,1}, a_{i,2}, \ldots, a_{i,n})$ is called the *ith row* of the matrix and is a row vector in \mathbb{F}^n . The entries $(a_{1,j}, a_{2,j}, \ldots, a_{m,j})$ is called the *jth column* of the matrix and is a column vector in \mathbb{F}^n . We denote the entry on the *ith* row and *jth* column as $A_{i,j}$. Furthermore, two $m \times n$ matrices, A and B, are equal if and only if $A_{i,j} = B_{i,j}$ for all $1 \leq i \leq m$ and $1 \leq j \leq n$; we denote this by A = B. Moreover, if n = m we say that A is a square matrix. Lastly, we denote the set of $m \times n$ matrices over \mathbb{F} as $M_{m \times n}(\mathbb{F})$.

Definition 2.1.4 (Polynomial Ring). Let \mathbb{F} be a field. Then the ring of polynomials in an indeterminate x over \mathbb{F} , denoted $\mathbb{F}[x]$ is defined as

$$\mathbb{F}[x] := \{ \sum_{i=0}^{n} a_i x^i | n \in \mathbb{N}, (a_0, a_1, \dots, a_n) \in \mathbb{F}^n, a_n \neq 0 \}.$$

Additionally, we define $x^0 = 1$. Moreover, for each $p = \sum_{i=0}^n p_i x^i \in \mathbb{F}[x]$, the degree of p, denoted $\deg p$, is n. Furthermore, if p = 0, that is $p_n = p_{n-1} = \ldots = p_0 = 0$, then p is called the zero polynomial and $\deg p = -1$ or $\deg p = -\infty$ depending on convention. If $\deg p = 0$, then we say p is a constant polynomial.

Lastly, $\mathbb{F}[x]$ forms a ring under the following operations where $p,q\in\mathbb{F}[x]$ and without loss of generality assume, $\deg p\geq \deg q$.

$$p + q = \sum_{i=0}^{\deg q} (p_i + q_i) x^i + \sum_{i=\deg q+1}^{\deg p} p_i x^i$$
$$pq = \sum_{k=0}^{\deg p \cdot \deg q} \left(\sum_{i+j=k} p_i q_j \right) x^k$$

2.1.2 Subspaces

Definition 2.1.5 (Subspace). A *subspace*, W, of a vector space, V, over a field, \mathbb{F} , is a subset of V that is also a vector space over \mathbb{F} .

Definition 2.1.6 (Matrix Transpose). Let M be an $m \times n$ matrix, then the transpose of M, denoted M^T , is the $n \times m$ matrix defined by $(M^T)_{i,j} = M_{j,i}$, that is

$$M^{T} = \begin{pmatrix} M_{1,1} & M_{2,1} & \dots & M_{m,1} \\ M_{1,2} & M_{2,2} & \dots & M_{m,2} \\ \vdots & \vdots & \ddots & \vdots \\ M_{1,n} & M_{2,n} & \dots & M_{m,n} \end{pmatrix}.$$

Definition 2.1.7 (Symmetric Matrix). Let M be a matrix, then if $M = M^T$, we say M is symmetric.

Definition 2.1.8 (Main Diagonal of a Matrix). Let \mathbb{F} be a field and let $M \in M_{n \times n}(\mathbb{F})$, then the main diagonal of M is the set $\{M_{i,i}\}_{i=1}^n$.

Definition 2.1.9 (Diagonal Matrix). Let \mathbb{F} be a field and let $A \in M_{n \times n}(\mathbb{F})$, then A is called a *diagonal matrix* if and only if whenever $i \neq j$, $A_{i,j} = 0$.

Definition 2.1.10 (Trace of a Matrix). Let \mathbb{K} be a field and let $M \in M_{n \times n}(\mathbb{K})$, then the trace of M denoted tr M is defined as

$$\operatorname{tr} M = \sum_{i=1}^{n} M_{i,i}$$

or the sum of the elements on the main diagonal.

Definition 2.1.11 (Sum of Subsets of a Vector Space). Let S, R be nonempty subsets of a vector space V, then the *sum of* S *and* R, denoted S + R is defined as $S + R = \{s + r | s \in S, r \in R\}$.

Chapter 3

Theorems

3.1 Vector Spaces

3.1.1 Introduction to Vector Spaces

Proposition 3.1.1. If u, v, w are elements of a vector space V such that x + z = y + z then, x = y.

Proposition 3.1.2. The zero vector in any vector space V is unique.

Proposition 3.1.3. Let V be a vector space and let $v \in V$, then there exists a unique $u \in V$ such that v + u = 0.

Proposition 3.1.4. Let V be a vector space over a field \mathbb{F} , then:

- 1. 0x = 0 for all $x \in V$;
- 2. a0 = 0 for all $a \in \mathbb{F}$;
- 3. (-a)x = -(ax) = a(-x) for all $x \in V$ and $a \in \mathbb{F}$.

3.1.2 Subspaces

Theorem 3.1.5. Let V be a vector space over a field \mathbb{F} and let $W \subseteq V$. Then W is a subspace of V if and only if all of the following are satisfied.

- $0 \in W$.
- For all $x, y \in W$, $x + y \in W$.
- For all $a \in \mathbb{F}$ and $x \in W$, $ax \in W$.

Theorem 3.1.6. Let V be a vector space over a field \mathbb{F} and let W be a countable collection of subspaces of V. Then

$$W_i = \bigcap_{W \in \mathcal{W}} W$$

is a subspace of V.

Proposition 3.1.7. For any matrix A, $\left[\left(A^{T}\right)^{T}\right]=A$.

Proposition 3.1.8. For any matrix A, $A + A^T$ is symmetric.

Proposition 3.1.9. Let \mathbb{K} be a field and let $A, B \in M_{n \times n}(\mathbb{K})$ and $a, b \in \mathbb{K}$, then $\operatorname{tr}(aA + bB) = a \operatorname{tr} A + b \operatorname{tr} B$.

Proposition 3.1.10. Let U, W be subspaces of a vector space V over a field \mathbb{F} . Then U + W is a subspace of V and is the smallest subspace containing both U and W.
